Mr. Shawn Persaud
Township of Tiny
130 Balm Beach Road West
Tiny, ON L0L 2J0

November 13, 2019

Dear Mr. Persaud:

RE: Letter of Objection to an Application for a Category 3 Class A Licence under the Aggregate Resources Act – North ½ of Lot 80, Concession 1, W.P.R & Part of Original Road Allowance between lots 80 and 81, Concession 1, W.P.R, Township of Tiny, County of Simcoe
(Cedarhurst Quarries and Crushing Limited (c/o CRH Canada Group Inc.)

Thank you very much for meeting with CRH on September 12, 2019 to discuss the status of the Township's technical review and we appreciated your acceptance of our October 4, 2019 follow up responses. On October 29, 2019 we received and reviewed the following peer review comments: Burnside Hydrological Peer Review dated September 11, 2019; Burnside Traffic Impact Peer Review dated September 11, 2019; Aercoustics Acoustic Peer Review dated July 10, 2019; Burnside Site Operation Peer Review dated September 11, 2019; and Severn Sound Environmental Association Natural Environment Peer Review dated September 27, 2019. Enclosed in attachment one is a chart summarizing the current status of the technical issues and additional CRH responses. Can the Township please provide these responses and attachments to the Township peer review team for confirmation that this addresses all outstanding issues.

We trust that this information adequately addresses the Township's outstanding comments. CRH will now update the site plans with the commitments as outlined in this letter, and provide a copy to the Township and MNRF.

If you have any questions, please do not hesitate to call.

Respectfully submitted,

Jessica Ferri, MCIP, RPP
Manager, Policy and Planning
CRH Canada Group Inc.

Figure 1: CRH Response

	Township Comment	CRH Response June 20, 2019	Status of Issue Based on September 12, 2019 Meeting	Peer Review Responses provided to CRH October 29, 2019	CRH Response Nov 7, 2019
Hydrogeological					
1.	The hydrogeological assessment completed by GHD does provide some additional information on the geology in the vicinity of the sump pond/wash pond, however there is no discussion on how water levels in the ponds relate to levels in the local aquitard, the Newmarket Till and the Upper Thorncliffe.	The sump and wash ponds are located on the adjacent Teedon Pit. Discussion on how the ponds relate to the geology is not related to the pit extension application. For reference, we have included an electronic copy of the report prepared by GHD for the Teedon Pit titled "Category 1 Permit-to-take-Water Renewal Application – Supporting Hydrologic and Hydrogeologic Study".	CRH maintains the position that the wash plant is unrelated to the extension application. The wash plant and pond are located on the existing pit and is governed by MECP. If MECP does not permit the renewal of the existing permit, CRH will still proceed with the extension application as proposed. At our September 12, 2019 meeting, the Township requested the borehole logs for all drill holes in the vicinity of the wash pond, cross section drawings and a memo from GHD summarizing the reasons that the washing operation will not adversely impact wells. As requested, please see attached letters from GHD: • Letter dated September	Additional comments from Burnside dated September 11, 2019: "Although the wash pond and sump are not located on the proposed new pit site, the wash ponds and sump will eventually be used to wash the aggregate extracted from the new pit. As result, the existing wash ponds and sump are integral to the operation at the proposed new pit. Therefore, their impact on groundwater and surface water resources in the area should be considered as part of the new pit application. The information presented in the PTTW renewal application documentation does not provide the necessary site-specific information to	The wash plant and pond are located on the existing pit and is governed by MECP. If MECP does not permit the renewal of the existing permit, CRH will still proceed with the extension application as proposed. At our September 12, 2019 meeting, the Township requested the borehole logs for all drill holes in the vicinity of the wash pond, cross section drawings and a memo from GHD summarizing the reasons that the washing operation will not adversely impact wells. CRH submitted this requested information on October 4, 2019. Please see attached letters from GHD: • Letter dated September 25, 2019

www.crhcanada.com

	• The current condition of nearby domestic wells be established, including the well depth and condition of the casing/screen, the well yield and general water quality.	that there would be no impact to local wells. To date there have been three (3) domestic well surveys completed: the first in 2015 was completed by Alpha Environmental where 27 wells were included; the second in 2017, was conducted by GHD on behalf of CRH where 5 were included; and the third, in 2018 included 78 domestic well surveys which was also conducted by GHD on behalf of CRH. For your information we have also included this report titled "2018 Domestic Well Survey" electronically.		"The majority of well concerns reported by residents were related to the presence of silt in their wells which many believed were the result of leakage from the wash pond. In their documentation of the domestic well survey GHD indicates the "the presence of the Local Aquitard would isolate the aggregate washing operations from the deeper aquifer". GHD should use the water level and geologic information from all the wells on the existing site and proposed expansion area to create cross sections that show the lateral and vertical extent of the Local Aquitard and how it relates to the domestic wells with reported siltation problems. Groundwater flow maps using the water level data from the site will be helpful in showing which domestic wells are downgradient of the existing and proposed site."	Neighbour well complaints are unrelated to extraction above the water table. For information purposes CRH has provided the Township with all additional work done completed by CRH. In addition, CRH forwarded the MECP letters that concur with the study's findings that well complaints are not caused by existing Teedon Pit operations. CRH has provided this information on October 4, 2019. Please see attached letters from GHD: • Letter dated September 25, 2019 regarding Professional Opinion Regarding Neighboring Domestic Wells • Letter dated September 23, 2019 regarding Response to Hydrogeological Comments #1, #2, and #3f

3(b)	• Manual monitoring be done at least monthly and that Automatic Water level Recorders (AWLR's) be installed so that the peak spring water levels in 2019 can be captured and used to confirm that the proposed Teedon Pit Extension pit floor elevation is 1.5 m above the high-water table.	AWLR's have already been installed in all the monitoring wells at both the Teedon Pit and the proposed extension lands. CRH commits to revising Note #42 on the proposed Teedon Pit Extension operations plan to reflect the Town's request to have AWLRs loggers installed and for the wells to be monitored monthly.	Item resolved.
3(c)	• An additional monitoring well be installed between MW9-18 and MW8-18 to provide data on the water table as there are no other wells on the Teedon Pit Extension property that are completed in the sand aquifer. Similarly, an additional well should be installed along the eastern edge of the proposed extraction area. Wells on the Teedon Pit to the south should be included in the	CRH commits to revise the Teedon Pit Extension site plans to include the additional following note: "One year prior to extraction commencing, two additional monitoring wells shall be installed. One between MW9-18 and MW8-18 and the second shall be installed along the eastern edge of the extraction area". The additional monitoring wells referenced above will be added to Note #42	Item resolved.

CRH Canada Group Inc. **T.** 905-761-7100

	begins operations. Water level collection only began in June 2018 and may have missed peak spring water levels.	Extension Operations Plan will be revised to reflect this, the requirement for monthly monitoring, as well as the addition of the 2 monitoring wells.			
3(f)	• Testing be completed to evaluate the connection between the existing wash pond and the underlying aquifer. This may require the installation of additional shallow monitoring wells near the wash pond so that the water table can be monitored, and vertical gradients can be calculated. If it is found that the pond has the potential to impact groundwater water quality/quantity, then consideration should be given to the installation of a liner.	The testing and monitoring requirements for the wash pond are not related to the Teedon Pit Extension and are subject to the PTTW application process. For reference refer to the GHD report titled "Category 1 Permit-to-take-Water Renewal Application – Supporting Hydrologic and Hydrogeologic Study".	See response to Item 1.	Additional comment from Burnside September 11, 2019: "The wash pond will be used to wash material from the proposed pit expansion and the comment above should be addressed." The reference to the "comment above should be addressed" is the same comment as shown in the left column.	No washing of aggregates is proposed on the extension property. Please refer to the response to Item 1.

Traffic			
4(a)	The Application material did not include a Traffic Impact Study, however it did include some traffic-related information. • In order to determine the impacts on Darby Road and on the Highway 93 intersection, a Traffic Impact Study (TIS) must be provided. It is acknowledged that the licensed extraction rate and truck volumes are not proposed to increase, however the length that the pit will be in operation will change. Based on the maximum annual extraction volume of 600,000 tonnes, it will take an additional 17 years of operation to exhaust the Teedon Pit Extension supply {assuming the existing Teedon Pit is near the end of its life). This should be a consideration in	As requested, CRH commits to conducting a Traffic Impact Assessment which will assist in determining the maneuverability conditions of Darby Road and will assess the intersection at Highway 93 & Darby Road. This will be completed and submitted to the Township for review.	Enclosed please find a copy of the traffic impact study prepared by C.F. Crozier & Associates Inc. dated October 4, 2019.

CRH Canada Group Inc. **T.** 905-761-7100
2300 Steeles Ave W, 4th floor **F.** 905-761-7200
Concord, Ontario
L4K 5X6 Canada www.crhcanada.com

	determining the revised traffic impact. • The alignment of Darby Road has a sharp bend at its intersection with Highway 93. The sight distances at this intersection are limited by the horizontal alignment on Highway 93. The traffic operations at the intersection of Darby Road and Highway 93 should be confirmed in the TIS. Safety issues (collision history) should be reviewed for the haul route (and intersection) to determine if there have been any incidents from the existing Teedon Pit operations.				
4(b)	• A scenario with 15 trucks idling close to the entrance before 5:00 am will impact the functionality of Darby Road in this area. This matter needs to be addressed.	A scenario with 15 trucks idling close to the entrance before 5:00 am is a scenario that should not occur. CRH encourages the Township to post no stopping signs along Darby Road to	Enclosed please find the TIS and please note the following information - The Township has agreed to install No Stopping signs along Darby Road at CRH's expense. CRH also commits to cover the cost	Additional comment from Burnside September 11, 2019: "The anticipated TIS report should confirm the measures proposed to address the potential for off-	CRH suggests the Township install "no parking" signs along Darby Road at CRH's expense. CRH also commits to cover the cost for paid OPP officers to monitor and ticket trucks in the

CRH Canada Group Inc.

F. 905-761-7200
www.crhcanada.com

		prevent this from occurring. CRH is prepared to cover the costs for the signage. If there are concerns related to the existing pit or proposed pit CRH remains committed to work with the Township and surrounding residents to ensure this is not happening. If required, CRH could open its gates earlier to avoid truck queuing on Darby Road. Item #5 from the Township of Tiny Staff Report (dated February 28, 2019) notes that there is no basis given for the estimate of 20 trucks incoming and ongoing from the pit on the worst peak hour. The model prepared in the Acoustic Assessment Report identified 20 trucks (40 passes) as being the maximum amount of trucks permitted in order to comply with MECP NPC-300 for Class 2 and 3 areas.	for paid OPP officers to monitor and ticket trucks in the event the No Stopping signs are not being adhered to. CRH also commits to communicate the hours of operation to its customers and truck drivers to prevent trucks from arriving prior to 5 am. As discussed at our meeting, during peak hours at the existing pit, there have been 20 trucks (40 truck trips) per hour and subject to approval of the extension, this will now be the maximum trips permitted in any given hour.	site queuing, as well as confirm whether off-site queuing has been observed under existing operations. The response suggests that the noise criteria will limit the truck volume to 40 trips in the peak hour. This maximum rate should be confirmed in the anticipated TIS and set out in the site plan agreement, along with monitoring provisions to ensure that this maximum is adhered to. The TIS should also provide an estimation of the peak hour truck trips that are currently experienced at the existing pit, to provide a sensitivity analysis as to whether the future traffic impacts are expected to increase, as compared to existing conditions.”	event the No Stopping signs are not being adhered to.. CRH continues to commit to communicate the hours of operation to its customers and truck drivers to prevent trucks from arriving prior to 5 am. As discussed at our meeting on September 12, 2019, during peak hours at the existing pit, there have been 20 trucks (40 truck trips) per hour and subject to approval of the extension, this will now be the maximum trips permitted in any given hour.

CRH Canada Group Inc.

F. 905-761-7200
www.crhcanada.com

4(c)	• It is noted that the Township has been approached by the Sarjeant Company Limited regarding a proposal to use the existing CRH entrance for their two pits. It is the Township's understanding that no formal application has been made to the MNRF relative to this proposal.	The potential Sarjeant proposal is unrelated to the proposed Teedon Pit Extension. As previously discussed with the Township, this scenario would require major site plan amendment under the Aggregate Resources Act to both Sargent and CRH's existing Teedon Pit site plans. No application has been made to the MNRF and if ever an application was to be submitted, the Township, County, and the public would be circulated for comment.	No application has been submitted and there are no plans to submit such an application. Although no application has been submitted, the Teedon Pit site plans will only permit a maximum of 15 trucks (30 truck trips) per hour prior to 7:00 am and 20 trucks (40 truck trips) per hour during daytime hours. This is the maximum number of trucks that can exist on the site per hour regardless of the origin of trucks.	Additional comment from Burnside September 11, 2019: "The anticipated TIS report should confirm CRH's position with respect to the potential interconnection between the two pits, as well as whether such interconnection could have merit from a traffic impact perspective. It is noted that the Township does not support the joint use of the Darby Road entrance for interconnection of the Sarjeant and CRH pits."	No application has been submitted and there are no plans to submit such an application. Although no application has been submitted, the Teedon Pit site plans will only permit a maximum of 15 trucks (30 truck trips) per hour prior to 7:00 am and 20 trucks (40 truck trips) per hour during daytime hours. This is the maximum number of trucks that can exist on the site per hour regardless of the origin of trucks.
Noise					
5(a)	A scenario with 15 trucks idling close to the entrance of the pit was modelled and it was found to have the potential to cause an objectionable noise impact. This matter needs to be addressed.	CRH is unclear why the Township's noise peer reviewer modelled this scenario. As noted above, a scenario with 15 trucks idling close to the entrance before 5:00 am is a scenario that should not occur. CRH	Item resolved.		

CRH Canada Group Inc. **T.** 905-761-7100

	NETR at station 3 and 4 (see Attachment E, Point Count Data Summary), however these station locations were not included in the SWH mapping shown on Figure 8. Further explanation is required.		
11.	Planting as proposed for Forest Edge Management should include follow-up survival assessments of planted stock. Replacement planting should be undertaken, if necessary due to poor stock survival.	CRH will commit to adding the following to the forest edge management zone A and B on the Teedon Pit Extension operation plan: "The forest edge management zones shall be monitored for survival in the first, second and fifth years after planting. Replacement planting should be undertaken if survival is less than 60% for each species."	Item resolved. As requested CRH will change the "should" to "shall". The revised note will read: "The forest edge management zones shall be monitored for survival in the first, second and fifth years after planting. Replacement planting shall be undertaken if survival is less than 60% for each species."
12.	Survival assessments for rehabilitation tree planting of setbacks and side slopes:	Note #7 on the Teedon Pit Extension Rehabilitation Plan already requires a one (1) and two (2) year assessment. CRH	Item resolved.

MEMORANDUM

To: **Brian Zeman, MHBC Planning**
Kevin Mitchell and Jessica Ferri, CRH Canada Group Inc.

From: **Anthony Goodban, Goodban Ecological Consulting Inc. (GEC)**

Date: **August 29, 2019**

Re: **Teedon Pit Extension**
2018 and 2019 Surveys for Eastern Whip-poor-will

Introduction

On March 25, 2019, the Midhurst District Office of the Ministry of Natural Resources and Forestry (MNRF) provided comments on the Teedon Pit Extension application in a letter to Ms. Jessica Ferri (Manager, Policy and Planning, CRH Canada Group Inc.). MNRF provided the following comments with respect to the Natural Environment Technical Report prepared by Goodban Ecological Consulting Inc. (GEC):

> *The proposed licence area appears to have strong suitability as potential habitat for the Eastern Whip-poor-will, a threatened species listed on the Species at Risk in Ontario (SARO) List. The roadside Whip-poor-will survey conducted on July 4, 2018 covered a broad area but there were no point counts conducted directly within the proposed licence boundary. To best assess the presence of Whip-poor-will during the breeding season, two surveys preferably within different lunar cycles are recommended.*
>
> *Additionally, Whip-poor-will vocalizations are most common in the early part of the breeding season and have been shown to decrease in July. As a result, MNRF requests that an additional whip-poor-will survey be completed that would include the area within the licence boundary and would incorporate two different lunar cycles between the period from late May to early July.*
>
> *We note that the Forked Three-awned Grass, an endangered species listed on the SARO list, was found on the subject property. Your company has registered for this species under Section 23.14 of Ontario Regulation 242/08 of the Endangered Species Act. We have no further comment on this matter.*

GEC completed the 2019 Eastern Whip-poor-will surveys as recommended by MNRF in their March 25, 2019 letter. This memorandum briefly describes the Eastern Whip-poor-will survey methods employed and presents the findings of the 2019 surveys.

2018 Eastern Whip-poor-will Survey

An Eastern Whip-poor-will nocturnal survey was completed on July 4-5, 2018. That night the moon was 68.9% illuminated. The survey extended from 2350 to 0230 hours. The weather was clear, wind was 1 on the Beaufort wind scale and temperature 25 to 24ÁC. Twenty-three (23) listening stops (3 minutes each) were made at the locations shown on **Figure 1**. The results of the 2018 survey was negative; no Eastern Whip-poor-wills were detected.

2019 Eastern Whip-poor-will Surveys

Nocturnal Surveys (Point Counts)

The Eastern Whip-poor-will survey windows for 2019 are presented in **Table 1**. The primary survey window is the 7 days leading up to a full moon, although the 7 days after the full moon may also be surveyed. Surveys were completed on June 11 and July 12. The surveys commenced at least 30 minutes after sunset.

Five stations were surveyed (Stations A to E) in 2019. Survey station locations are shown on **Figure 1**. Station A is located in the middle of the proposed Teedon Pit Extension extraction area. For each survey, a 15 minute point count was completed at Station A and 5 minute point counts were completed for Stations B to E.

Table 1: Eastern Whip-poor-will Survey Schedule - Southern Ontario 2019

Window	Full Moon	Primary Survey Window	Secondary Survey Window	Teedon Pit Ext. Survey Date
• Early Window (during migration period)	18 May	11 May - 18 May	19 May - 26 May	
• Mid-season Window (Breeding Season) • Optimal Timing	17 June	10 June - 17 June	18 June - 25 June	June 11
• Late Window (Breeding Season)	19 July	9 July - 16 July		July 12

Source for survey windows:

http://www.couchichingconserv.ca/general-info/volunteer/whip-poor-will-survey-window-2019/

On June 11, 2019, sunset was at 2102. The survey commenced at 2135. Winds were very light (0 to 1 on the Beaufort Wind Scale) and the sky was clear with very few clouds. Air temperature was 13^{o}C at 2100. That night the moon was 70.0% illuminated. The survey was completed around 2240. No Eastern Whip-poor-wills were detected during the June 11 nocturnal survey.

On July 12, 2019, sunset was at 2102. The survey commenced at 2140. Winds were very light (0 to 1 on the Beaufort Wind Scale) and the sky was clear with very few clouds. Air temperature was 16^{o}C at 2100. That night the moon was 85.7% illuminated. The survey was completed around 2245. No Eastern Whip-poor-wills were detected during the July 12 nocturnal survey.

Song Meter SM4 Recordings

To augment the 2019 Eastern Whip-poor-will nocturnal surveys, a Song Meter SM4 recorder was deployed at Station A on June 11, near the middle of the proposed Teedon Pit Extension extraction area (see **Figure 1**). The SM4 unit was programmed to record for 10 minute intervals starting 30 minutes, 90 minutes and 150 minutes after sunset. The SM4 unit was retrieved on the evening of the July 12 nocturnal survey.

Recordings from June 11 to 25 and July 9 to 11 were analyzed. No recordings of Eastern Whip-poor-will recordings were made. The SM4 unit recorded crickets, songbirds, Coyotes howling in the distance, small aircraft and vehicles on Darby Road and Highway 93, so it would certainly have picked up the loud song of the Eastern Whip-poor-will if any were present during the survey periods.

Conclusion

MNRF requested that an additional Eastern Whip-poor-will survey be completed in 2019 that would include the area within the proposed Teedon Pit Extension licence boundary and incorporate two different lunar cycles between the period from late May to early July.

GEC completed nocturnal surveys for Eastern Whip-poor-will on June 11, within the optimal breeding season survey window, and July 12, within the late breeding season survey window. The two surveys were completed during two separate lunar cycles. Point Count Station A was located in the middle of the proposed Teedon Pit Extension extraction area. A Song Meter SM4 recorder was also deployed at Station A from June 11 to July 12, to augment the nocturnal surveys.

In 2018 and 2019, no Eastern Whip-poor-will were detected during targeted surveys. It is concluded that the Teedon Pit Extension and adjacent land is not habitat for this species.

CONSULTING ENGINEERS

1.0 Executive Summary

C.F. Crozier & Associates Inc. (Crozier) was retained by CRH Canada Group Inc. (CRH) to prepare a Traffic Impact Study to assess traffic operations as a result of comments from the Township of Tiny on the proposed Teedon Pit Extension. The Teedon Pit is located at 40 Darby Road in the Township of Tiny and the proposed Teedon Pit Extension is adjacent to the existing Teedon Pit.

CRH is proposing an extension of the existing Teedon Pit operations to replace reserves for future customer supply. The annual licensed extraction rate and annual truck volumes associated with the Teedon Pit are not proposed to increase.

Based on existing conditions, there are currently maneuverability constraints on Darby Road at Highway 93 for heavy trucks travelling to and from the Teedon Pit. Trucks on Darby Road were observed utilizing the entire width of the roadway when traversing the curve on Darby Road at Highway 93, which has resulted in the roadside shoulders being rutted from tire tracks.

This study reviews the following main aspects of the intersection of Darby Road / McMann Sideroad and Highway 93 from a transportation engineering perspective:

- Traffic operations under existing conditions and future conditions;
- Sight distance availability and requirements;
- Traffic safety (i.e. collision history and trends); and
- Intersection improvements to improve truck operations.

The intersection is currently operating at acceptable levels of service with minor delays and no capacity constraints and is expected to continue operating acceptably in the 20-year horizon.

The available intersection sightlines on Highway 93 at the west approach (Darby Road) of the intersection exceed minimum sight distance requirements for both northbound and southbound movements.

The observed collision rate at the intersection is low and does indicate any collision trends that require attention.

Therefore, **no issues pertaining to intersection capacity, sight distance or collision trends were identified at the intersection of Darby Road / McMann Sideroad and Highway 93 related to the existing operation or proposed extension**

To improve heavy truck turning operations at Darby Road and Highway 93, **the widening of Darby Road at the west approach of the intersection is recommended.** This design would mitigate truck turning maneuverability issues and allow for simultaneous inbound and outbound truck turning movements.

A functional design for the Highway 93 and Darby Road intersection improvements is included as **Appendix J.**

In conclusion, the proposed extension of the Teedon Pit operations is supportable from a transportation operations and safety perspective, with the implementation of the noted intersection improvements.

TABLE OF CONTENTS

LIST OF TABLES

LIST OF APPENDICES

LIST OF FIGURES

2.0 Introduction

2.1 Background

C.F. Crozier & Associates Inc. (Crozier) was retained by CRH Canada Group Inc. (CRH) to prepare a Traffic Impact Study to assess traffic operations as a result of comments from the Township of Tiny on the proposed Teedon Pit Extension. The Teedon Pit is located at 40 Darby Road in the Township of Tiny and the proposed Teedon Pit Extension is adjacent to the existing Teedon Pit.

CRH is proposing an extension of the existing Teedon Pit operations to replace reserves for future customer supply. The annual licensed extraction rate of 600,000 tonnes and annual truck volumes associated with the Teedon Pit are not proposed to increase, and if the extension is approved, the annual tonnage of 600,000 will be an annual limit for the Teedon Pit and Extension combined.

The proposed hours of operation of the Teedon Pit and extension will be as follows:

- **Shipping:** Monday to Friday between 5:00 a.m. – 7:00 p.m., and Saturday from 5:00 a.m. – 4:00 p.m.
- **Site Preparation, Extraction, Processing and Rehabilitation:** Monday to Friday between 7:00 a.m. – 7:00 p.m.
- **Extraction and Processing:** Saturday from 9:00 a.m. – 4:00 p.m.

Between the hours of 5:00 a.m. – 7:00 a.m. only shipping is permitted and may include a maximum of 15 highway trucks per hour (30 truck trips) and a maximum of one shipping loader in combination with the existing Teedon Pit (license #3670).

Between the hours of 7:00 a.m. – 7:00 p.m., highway trucks are limited to 20 trucks per hour (40 passes per hour) in combination with the existing Teedon Pit (license #3670).

There will be no operations on Sundays or statutory holidays. There are no time restrictions for site maintenance and equipment servicing.

Based on existing conditions, there are currently maneuverability constraints on Darby Road at Highway 93 for heavy trucks travelling to and from the Teedon Pit. Existing operations are discussed further in Section 3.4. This Traffic Impact Study analyzes truck operations at the intersection of Darby Road / McMann Sideroad and Highway 93 associated with the Teedon Pit and analyzes potential intersection improvements to improve truck operations.

Highway 93 is under the jurisidiction of the Ministry of Transportation of Ontario (MTO). Therefore, this Traffic Impact Study is also subject to review by the MTO.

2.2 Purpose and Scope

The purpose of a typical Traffic Impact Study is to evaluate the potential impacts of traffic generated by future development and to recommend mitigation measures on the external road network to support the development, if required. However, the application filed by the client has indicated that the licensed extraction rate and truck volumes associated with the Teedon Pit are not proposed to increase.

Therefore, this study reviews the following main aspects of the intersection of Darby Road / McMann Sideroad and Highway 93 from a transportation engineering perspective:

- Traffic operations under existing conditions and future conditions;
- Sight distance availability and requirements;
- Traffic safety (i.e. collision history and trends); and
- Intersection improvements to improve truck operations.

The study has been completed in accordance with the "Guidelines for the Preparation of Traffic Impact Studies (MTO, September 2014)" as well as agreed upon terms of reference with MTO staff. **Appendix A** contains the correspondence with the MTO.

3.0 Existing Conditions

3.1 Teedon Pit

The existing Teedon Pit is located at 40 Darby Road to the south of the intersection of Darby Road / McMann Sideroad and Highway 93 and is bound by the proposed pit extension to the north, agricultural lands to the south and west, and Darby Road to the east.

Figure 1 contains the Site Location Plan.

3.2 Study Intersections

The Traffic Impact Study analyzes the intersection of Darby Road / McMann Sideroad and Highway 93.

3.3 Boundary Road Network

The boundary road network at the site frontage is described in **Table 1**.

Table 1: Boundary Road Network

Feature	Roadway		
	Darby Road	**Highway 93**	**McMann Sideroad**
Direction	Two-way (north-south) [1]	Two-way (north-south)	Two-way (east-west)
Classification	Local Road	Provincial Highway	Local Road
Jurisdiction	Township of Tiny	MTO	Township of Tay
Area Type	Rural	Rural	Rural
Speed Limit	50 km/h	80 km/h	80 km/h (assumed)
Number of lanes	Two	Two	Two
Surface type	Asphalt	Asphalt	Granular
Median type	None	None	None
Pedestrian / Cycling Facilities	None	None	None

Note 1: While Darby Road spans primarily north-south, the roadway spans east-west at its intersection at Highway 93.

The intersection of Darby Road / McMann Sideroad and Highway 93 is unsignalized with side-street stop control at the east and west approaches of the intersection. There are auxiliary northbound and southbound right-turn tapers on Highway 93 at the intersection to allow right-turning traffic to decelerate and not interfere with through traffic.

There is a sharp horizontal curve on Darby Road approaching Highway 93.

Figure 2 illustrates the existing boundary road network, including lane configurations, storage lengths, and intersection control.

3.4 Field Observations

Field observations by Crozier staff in at the west approach of the intersection of Darby Road / McMann Sideroad and Highway 93 indicate that trucks on Darby Road are utilizing the entire width of the roadway when traversing the curve on Darby Road at Highway 93, and that the roadside shoulders are rutted from tire tracks. While there were no opposing vehicles turning from Highway 93 to Darby Road when heavy trucks were traversing Darby Road, field observations indicate that the road width of the west approach would not be sufficient to accommodate both a truck turning and any opposing vehicles.

3.5 Traffic Data

Turning movement counts were conducted by Spectrum Traffic Data Inc. staff at the intersection of Darby Road / McMann Sideroad and Highway 93 on Saturday June 1, 2019 between 5:00 a.m. – 4:00 p.m., and Tuesday June 4, 2019 between 5:00 a.m. – 7:00 p.m. These time periods reflect the proposed hours of operation for the Teedon Pit.

The traffic count data is contained in **Appendix B**. **Figure 3** illustrates the 2019 existing traffic volumes that were recorded.

Intersection analysis was conducted utilizing peak hour factors (PHFs) as calculated for each intersection during each time period. **Table 2** outlines the calculated peak hour factors at each intersection during each peak hour.

Table 2: Peak Hour Factors

Intersection	Peak Hour	Peak Hour Factor
Darby Road / McMann Sideroad and Highway 93	Weekday 4:15 p.m. – 5:15 p.m.	0.91
	Saturday 11:00 a.m. – 12:00 p.m.	0.92

3.6 Traffic Modelling

The boundary road network was modelled in Synchro 9.2 using existing roadway geometrics, collected traffic data, and default modelling parameters such as ideal saturation flow rates and lost time values.

The assessment of intersections is based on the "Highway Capacity Manual (HCM)" methodology. Intersections are assessed using a Level of Service (LOS) metric with ranges of delay assigned a letter from "A" to "F"; "A" representing low delays and "F" representing heavy delays. The LOS definitions for signalized and unsignalized intersections are included in **Appendix C.**

3.7 Intersection Operations

The existing intersection operations at the intersection of Darby Road / McMann Sideroad and Highway 93 were analyzed using the existing traffic volumes illustrated in **Figure 3.** Detailed capacity analysis worksheets are included in **Appendix D**.

Table 3 outlines the 2019 existing traffic operations.

Table 3: 2019 Existing Traffic Operations

Intersection	Control	Peak Hour	Level of Service [1]	Control Delay	Critical v/c ratio [2]	95th Percentile Queue Length > Storage Length
Darby Road / McMann Sideroad and Highway 93	Stop (Minor)	Weekday	C	21.6 s (WBLTR)	0.02 (EBLTR)	None
		Saturday	C	16.3 s (EBLTR)	0.03 (EBLTR)	None

Note 1: The Level of Service of a signalized intersection is based on the average control delay per vehicle (Synchro/ICU). The Level of Service of a stop-controlled intersection is based on the delay associated with the critical minor road approach (HCM2000).

Note 2: The critical v/c ratio is considered to be the maximum v/c ratio for movements at the intersection. In addition, all v/c ratios greater than 0.85 for movements are outlined and highlighted.

The intersection of Darby Road / McMann Sideroad and Highway 93 is currently operating at LOS "C" during the weekday and Saturday peak periods with minor control delays and no critical volume-to-capacity ratios nor 95th percentile queue lengths. These operations indicate that the intersection is currently operating at satisfactory levels of service with reserve capacity for future traffic growth.

4.0 Future Conditions

4.1 Horizon Years

This study analyzes future traffic conditions for a 20-year horizon (2039).

4.2 Truck Traffic Volumes

It is noted that the existing traffic counts reflect the existing permitted maximum truck volume of 20 trucks per hour (40 truck trips) associated with the Teedon Pit between the hours of 7:00 a.m. – 7:00 p.m. As the Teedon Pit extension does not propose an increase in truck volumes, no additional truck forecasts were conducted for the Teedon Pit extension under future conditions.

4.3 Growth Rate

Historical growth rates were derived from Annual Average Daily Traffic (AADT) and Summer Average Daily Traffic (SADT) on Highway 93 in the study area to forecast future traffic volumes. The latest AADT data available is for 2016; thus, growth rates from 2012 to 2016 were analyzed. **Appendix E** contains the growth rate data and analysis.

The AADT from 2012 to 2016 yielded a growth rate of 1.0% compounded annually and the SADT from 2012 to 2016 yielded a growth rate of 0.6% compounded annually. Therefore, a growth rate of 1.0% compounded annually was applied to through traffic on Highway 93 to forecast 2039 future traffic volumes.

Figure 4 illustrates the 2039 future traffic volumes.

4.4 Signal Warrant Analysis

A signal warrant analysis was conducted for the intersection of Darby Road / McMann Sideroad and Highway 93 under 2039 future volumes. The analysis followed the procedures specified in Chapter 4 of the "Ontario Traffic Manual – Book 12", March 2012. Justifications 1 (Minimum Vehicular Volume), 2 (Delay to Cross Traffic), 3 (Combination of Justifications 1 and 2), and 4 (4-Hour Volume) were selected as the most appropriate warrants with which to assess the intersection of Darby Road / McMann Sideroad and Highway 93.

Signal warrant analysis was conducted for both the weekday and Saturday periods to determine signal requirements. The highest eight hours of each day were used in the analysis with each hour volume increased by approximately 1.22 (1% compounded annually over 20 years) to reflect 2039 future conditions.

As the posted speed limit on Highway 93 is 80 km/h, a "free flow" type was applied to traffic flow on Highway 93 for the signal warrant analysis.

Table 4 outlines the results of the signal warrant analysis.

Table 4: Signal Warrant Analysis Results

Location	Flow Type	Horizon Year	Number of Lanes on Major Road	Time Period	% Warranted	Traffic Signals Warranted?
Darby Road / McMann Sideroad and Highway 93	Free Flow	2039	Two	Weekday	9%	**No**
				Saturday	5%	**No**

The results of the signal warrant analysis indicate that traffic signals are not warranted at the intersection of Darby Road / McMann Sideroad and Highway 93 under 2039 future traffic conditions. This is attributed to the low turning volumes from Darby Road and McMann Sideroad onto Highway 93.

Appendix F contains the signal warrant sheets.

4.5 Left-Turn Lane Warrant Analysis

Auxiliary left-turn lane warrant analysis was conducted for the intersection of Darby Road / McMann Sideroad and Highway 93 under 2039 future traffic conditions. The analysis was conducted using the Ministry of Transportation (MTO)'s "Design Supplement for TAC Geometric Design Guide for Canadian Roads – June 2017." The northbound and southbound left-turn movements were analyzed for left-turn lane requirements.

The design speed of a roadway in an urban environment is typically 10-20 km/h greater than the posted speed limit. The posted speed limit on Highway 93 is 80 km/h. Therefore, a design speed of 100 km/h was assumed for the left-turn lane warrant analysis.

The weekday and Saturday peak hours of the intersection of Darby Road / McMann Sideroad and Highway 93 reflect the peak hours of the traffic volumes on Highway 93 given the comparably lower volumes on Darby Road and McMann Sideroad. However, the weekday and Saturday peak hour volumes do not reflect the highest northbound and southbound left-turn volumes at the intersection. Therefore, for the purposes of conservative analysis, the highest hourly northbound and southbound left-turn volumes observed at the intersection for both the weekday and Saturday time periods were analyzed. The volumes were increased by approximately 1.22 (1% compounded annually over 20 years) to reflect 2039 future conditions.

Table 5 outlines the results of the left-turn lane warrant analysis.

Table 5: Left-Turn Lane Warrant Analysis Results

Location	Movement	Design Speed	Horizon Year	Number of Lanes on Major Road	Left-Turn Lane Storage Requirement?
Darby Road / McMann Sideroad and Highway 93	Northbound left-turn	100 km/h	2039	Two	**None**
	Southbound left-turn	100 km/h	2039	Two	**None**

The results of the left-turn lane analysis indicate that no exclusive left-turn lanes are warranted on Highway 93 at Darby Road under 2039 future traffic conditions. This is attributed to the low turning volumes from Highway 93 to Darby Road and McMann Sideroad not triggering the minimum requirements for left-turn lanes.

Appendix G contains the left-turn warrant analysis worksheets.

4.6 Intersection Operations

The future intersection operations at the study intersections were analyzed using the 2039 future traffic volumes outlined in **Figure 4.** Detailed capacity analysis worksheets are included in **Appendix D**.

Table 6 outlines the 2039 future traffic operations, respectively.

Table 6: 2039 Future Traffic Operations

Intersection	Control	Peak Hour	Level of Service [1]	Control Delay	Critical v/c ratio [2]	95th Percentile Queue Length > Storage Length
Darby Road / McMann Sideroad and Highway 93	Stop (Minor)	Weekday	D	29.0 s (WBLTR)	0.03 (EBLTR)	None
		Saturday	C	19.6 s (EBLTR)	0.04 (EBLTR)	None

Note 1: The Level of Service of a signalized intersection is based on the average control delay per vehicle (Synchro/ICU). The Level of Service of a stop-controlled intersection is based on the delay associated with the critical minor road approach (HCM2000).

Note 2: The critical v/c ratio is considered to be the maximum v/c ratio for movements at the intersection. In addition, all v/c ratios greater than 0.85 for movements are outlined and highlighted.

The intersection of Darby Road / McMann Sideroad and Highway 93 is expected to change from LOS "C" to "D" during the weekday peak period under 2039 future traffic conditions with an increase in control delay of 7.4 seconds and increase in volume-to-capacity ratio of 0.01. These operations are attributed to 20 years of steady traffic growth on Highway 93. However, these operations are still considered acceptable.

Therefore, the intersection of Darby Road / McMann Sideroad and Highway 93 is expected to operate satisfactorily from a capacity perspective.

5.0 Sight Distance Analysis

The available sightlines at the west approach of Darby Road / McMann Sideroad and Highway 93 were measured and compared to the standards set out in the Transportation Association of Canada (TAC) Geometric Design Guide for Canadian Roads (GDGCR).

The design speed of a roadway in an urban environment is typically 10-20 km/h greater than the posted speed limit. The posted speed limit on Highway 93 is 80 km/h. Therefore, a design speed of 100 km/h was assumed for the sight distance analysis.

Given the truck traffic at the west approach of Darby Road / McMann Sideroad and Highway 93, a combination truck (WB-19 or WB-20 tractor semi-trailer) was used as the design vehicle for determining sight distance requirements. It is noted that the trucks entering and exiting the Teedon Pit will consist of Pony Pup trailers which would result in a total truck length of approximately 17-18 metres (less than

the length of a typical WB-19 or WB-20 tractor semi-trailer). Therefore, the base time gap of 11.5 seconds used in the analysis below can be considered conservative.

Table 7 outlines the sight distance analysis for the proposed site accesses.

Table 7: Sight Distance Analysis

Feature	Darby Road
Access Type	Full Moves
Assumed Design Speed	100 km/h
Vehicle Type	Combination Truck (WB-19 or WB-20)
Base Time Gap	11.5 s [1]
Additional Time Gap	None
Grade of Roadway	Less than 3%
Horizontal Alignment of Roadway	Curve
Sight Distance Required	320 m [2]
Measured Sight Distance	Approx. 350 m to south > 500 m to north
Minimum Sight Distance Satisfied?	Yes

Note 1: Time gap for left-turning combination trucks from a stop onto a two-lane highway with no median and with a grade less than 3%. Value from Table 9.9.3 in the GDGCR.
Note 2: Sight distance values calculated from Intersection Sight Distance equation 9.9.1 in the GDGCR.

Therefore, safety issues pertaining to sight distance were not identified at the intersection of Darby Road / McMann Sideroad and Highway 93.

6.0 Collision Analysis

The Township of Tiny requested that collision analysis be conducted for the intersection of Darby Road / McMann Sideroad and Highway 93 to identify and address any collision trends at the intersection.

The MTO provided Crozier with collision history for the intersection of Darby Road / McMann Sideroad and Highway 93 from 2013 to 2019. **Appendix H** contains the collision history provided by the MTO.

The collision history within the last five years (i.e. 2015 to 2019) was analyzed. **Table 8** summarizes the collision history within the last five years.

Table 8: Five-Year Collision History

Date and Time of Collision	Collision Type	Location	Injury?	Road Conditions	Description	Notes
December 24, 2018 11:32 a.m.	Turning	Darby Road at Highway 93	Property Damage Only	Snow covered	Driver 1 (northbound) on Highway 93 slid into Driver 2 on Highway 93 waiting to turn left	N/A
May 4, 2017 6:30 p.m.	Single-Manned Vehicle (SMV) / Other	Darby Road north of Highway 93	Minor	Wet	Driver 1 (southbound) on Highway 93 struck cable guide rail, skidded and rolled over; struck Driver 2	Driver 1 impaired

As outlined above, there have been two reported collisions at the intersection of Darby Road / McMann Sideroad and Highway 93 within the last five-years. The following formula from the Highway Safety Manual (published by the American Association of State Highway and Transportation Officials) was used to quantify the collision rate at the intersection:

$$RMEV = (A * 1{,}000{,}000) / V$$

Where;
RMEV = Rate per million entering vehicles
A = number of collisions (total or by type) occurring in a single year at the location
*V = daily volume * 365*

A value of 0.4 was applied to the "A" parameter to reflect two collisions within the last five years. The latest AADT observed on Highway 93 is 7,750 vehicles per day.

The collision rate at the intersection of Darby Road / McMann Sideroad and Highway 93 was determined to be approximately 0.14 collisions per million entering vehicles. A collision rate of 1.5 collisions per million entering vehicles is commonly used as a general rule-of-thumb to indicate collision issues at an intersection. Therefore, the observed collision rate of 0.14 collisions per million entering vehicles is low.

Additionally, both reported collisions are attributed to wet or snow-covered road conditions. It is further noted that one of the collisions involved an impaired driver, indicating that these collisions are more attributed to human error than intersection characteristics. It is also noted that neither of these collisions involved heavy trucks.

Therefore, safety issues pertaining to collision trends were not identified at the intersection of Darby Road / McMann Sideroad and Highway 93.

7.0 Intersection Geometrics Analysis

The existing geometrics at the intersection of Darby Road / McMann Sideroad and Highway 93 were evaluated to identify opportunities to improve heavy truck turning operations and maneuverability.

To address this existing condition, the widening of Darby Road at the west approach of the intersection of Darby Road and Highway 93 is recommended while maintaining the existing horizontal

alignment. The widening of the roadway within the horizontal curve would improve heavy truck maneuverability to and from the Teedon Pit.

Field observations by Crozier staff identified an Enbridge Natural Gas Pipeline marker adjacent to Darby Road in the vicinity of the road widening. This pipeline has not been considered as part of the functional design (see **Appendix J**) but will be co-ordinated with Enbridge Inc. directly during the detailed design stage.

7.1 Implementation of Road Widening

A vehicle turning analysis was conducted for a WB-20 tractor semi-trailer turning onto and from Darby Road at Highway 93 to determine the required extents for the widening of Darby Road. **Appendix I** contains the vehicle turning analysis for a WB-20 tractor semi-trailer turning onto and from Darby Road at Highway 93.

As discussed earlier, the trucks entering and exiting the Teedon Pit will consist of Pony Pup trailers which would result in a total truck length of approximately 17-18 metres (less than the length of a typical WB-19 or WB-20 tractor semi-trailer). Therefore, the use of a WB-20 tractor semi-trailer in the vehicle turning analysis is considered conservative.

Additionally, best practices from the TAC GDGCR were incorporated into the intersection improvements. The TAC GDGCR recommends the implementation of a recovery taper beyond the intersection in conjunction with a right-turn taper to allow turning vehicles to safely return to the through lane. The implementation of a recovery taper on Highway 93 south of Darby Road would allow for an increased curb radius for heavy truck turning movements and allow turning trucks to gradually transition into the through lane. While the TAC GDGCR recommends a recovery taper length of 30 metres and offset of 1.5 metres, a recovery taper length of 50 metres and offset of 3.0 metres was included to accommodate heavy truck right-turn movements from Darby Road onto Highway 93 without navigating over the shoulder or into the opposing northbound lane on Highway 93.

Table 9 outlines the recommended geometrics at the intersection of Darby Road and Highway 93 to mitigate heavy truck turning maneuverability issues and allow simultaneous inbound and outbound truck turning movements.

Table 9: Recommended Geometrics at Darby Road and Highway 93

Location	Parameter	Recommended Value
Darby Road (west of Highway 93)	Pavement Width	14.0 metres (7.0 metre lanes)
Darby Road at Highway 93 (west approach)	Curb Radii	17 metres (northwest intersection corner) 15 metres (southwest intersection corner)
Highway 93 (south of Darby Road)	Recovery Taper	50 metres (length) 3.0 metres (offset)

It is recommended that the existing Darby Road centreline be maintained, and that the roadway be widened on both sides. This approach would maintain the geometric alignment between Darby Road and McMann Sideroad. If Darby Road were to be widened entirely on one side of the roadway, the roadway centreline would shift and result in a skewed intersection approach opposite McMann Sideroad which could lead to potential vehicle-vehicle conflicts.

Appendix J contains the functional design for the Darby Road and Highway 93 intersection improvements.

The proposed intersection design can occur within the existing right-of-way (ROW) limits.

8.0 Conclusions

The analysis contained within this report has resulted in the following key findings at the intersection of Darby Road / McMann Sideroad and Highway 93:

- The intersection is currently operating at acceptable levels of service with minor delays and no capacity constraints.
- The intersection is expected to continue operating at acceptable levels of service with minor delays and no capacity constraints in the 20-year horizon.
- The available intersection sightlines on Highway 93 at the west approach (Darby Road) of the intersection exceed minimum sight distance requirements for both northbound and southbound movements.
- The observed collision rate at the intersection is low and does indicate any collision trends that require attention.
- Therefore, **no issues pertaining to intersection capacity, sight distance or collision trends were identified at the intersection of Darby Road / McMann Sideroad and Highway 93 related to the existing operations or proposed extension**.

To improve heavy truck turning operations at Darby Road and Highway 93, **the widening of Darby Road at the west approach of the intersection is recommended.** This design would mitigate truck turning maneuverability issues and allow for simultaneous inbound and outbound truck turning movements.

A functional design for the Highway 93 and Darby Road intersection improvements is included as **Appendix J.**

In conclusion, the proposed extension of the Teedon Pit operations is supportable from a transportation operations and safety perspective, with the implementation of the noted intersection improvements.

The TOR sounds good. Please note we have had complaints at this intersection due to truck traffic related to the below concerns (poor geometry).

Nelson – Please provide the collision history.

Hi Peter,

I've attached a map showing Darby Road and the Teedon Pit in relation to Highway 93. The map also includes a key plan showing the site location in relation to the surrounding area.

Hope this helps,

Hi Darren.

Do you have a plan of the pit location in relation to the 93/Darby intersection?

Iôm not familiar with Teedon Pit.

Thanks,

Peter D.

Subject: Darby Road and Highway 93 TIS Proposed Terms of Reference (1028-5282)

Good afternoon Peter,

We have been retained by CRH Canada Group Inc. (CRH) to prepare a Traffic Impact Study to assess traffic operations associated with the Teedon Pit located at 40 Darby Road in the Township of Tiny. CRH is proposing an expansion of the existing Teedon Pit operations to allow for longer extraction periods, although the licensed extraction rate and truck volumes associated with the Teedon Pit are not proposed to increase.

There are currently maneuverability constraints on Darby Road for heavy trucks travelling to and from the Teedon Pit. Field observations by Crozier staff at the west approach of the intersection of Darby Road and Highway 93 indicate that trucks on Darby Road are utilizing the entire width of the roadway when traversing the curve on Darby Road at Highway 93, and that the roadside shoulders were rutted from tire tracks.

The Township requires a Traffic Impact Study that analyzes truck operations at the intersection of Darby Road and Highway 93 associated with the Teedon Pit and analyzes potential intersection improvements to improve truck operations. Given the proximity to Highway 93, we understand that the MTO will also require a Traffic Impact Study.

Our proposed Terms of Reference for the Traffic Impact Study is outlined below:

1. Traffic counts have already been conducted at the intersection of Darby Road and Highway 93 on Saturday June 1, 2019 between 5:00 a.m. – 4:00 p.m., and Tuesday June 4, 2019 between 5:00 a.m. – 7:00 p.m. These time periods reflect the proposed hours of operation for the Teedon Pit.
2. Existing traffic operations at Darby Road and Highway 93 will be analyzed during the weekday and Saturday peak hours using Synchro 9.2.
3. The Township estimates that based on the maximum annual extraction volume of 600,000 tonnes, it would take approximately 17 years of operation to exhaust the Teedon Pit supply. However, this estimate also assumes that the existing Teedon Pit is nearing the end of its life. Accordingly, analysis of the 20-year horizon (2039) will be conducted to allow for a buffer on the 17-year estimate and result in more conservative analysis.
4. Future background traffic growth will be calculated using growth rates calculated from Annual Average Daily Traffic (AADT) and Summer Average Daily Traffic volumes on Highway 93 in the study area.
5. 2039 future traffic operations at Darby Road and Highway 93 will be analyzed during the weekday and Saturday peak hours.
6. Sight distance availability will be analyzed at the west approach of Darby Road at Highway 93 to compare to the minimum sight distance requirements set out in the MTO's "Design Supplement for TAC Geometric Design Guide for Canadian Roads- June 2017".
7. Traffic safety will be analyzed at the intersection of Darby Road and Highway 93. The following traffic safety components will be analyzed:
    a. Collision trends and counter-measures to address, if required
    b. Vehicle turning requirements for heavy trucks at the west approach of Darby Road and Highway 93
    c. Auxiliary left-turn lane requirements on Highway 93
    d. Intersection control (traffic signal warrant analysis will be conducted)
8. The analysis contained in this TIS will lead to recommendations for intersection improvements at Darby Road and Highway 93 to optimize traffic safety.

We would like to request the collision history for the intersection of Darby Road and Highway 93 for us to complete our analysis. If you could forward this request or direct us to the appropriate contact, that would be much appreciated!

If the proposed Terms of Reference is satisfactory to the MTO, we will begin preparing the TIS immediately.

Alex and Ryan (copied) are both on vacation next week. However, if you have any questions or wish to discuss further within the next week, please do not hesitate to give me a call.

Cheers,
Darren

Peak Hour: 11:00 AM - 12:00 PM Weather: Few Clouds (10.42 °C)

APPENDIX C

Level of Service Definitions

Level of Service Definitions

Two-Way Stop Controlled Intersections

Level of Service	Control Delay per Vehicle (seconds)	Interpretation
A	≤ 10	EXCELLENT. Large and frequent gaps in traffic on the main roadway. Queuing on the minor street is rare.
B	> 10 and ≤ 15	VERY GOOD. Many gaps exist in traffic on the main roadway. Queuing on the minor street is minimal.
C	> 15 and ≤ 25	GOOD. Fewer gaps exist in traffic on the main roadway. Delay on minor approach becomes more noticeable.
D	> 25 and ≤ 35	FAIR. Infrequent and shorter gaps in traffic on the main roadway. Queue lengths develop on the minor street.
E	> 35 and ≤ 50	POOR. Very infrequent gaps in traffic on the main roadway. Queue lengths become noticeable.
F	> 50	UNSATISFACTORY. Very few gaps in traffic on the main roadway. Excessive delay with significant queue lengths on the minor street.

Adapted from Highway Capacity Manual 2000, Transportation Research Board

Level of Service Definitions

Signalized Intersections

Level of Service	Control Delay per Vehicle (seconds)	Interpretation
A	≤ 10	EXCELLENT. Extremely favourable progression with most vehicles arriving during the green phase. Most vehicles do not stop and short cycle lengths may contribute to low delay.
B	> 10 and ≤ 20	VERY GOOD. Very good progression and/or short cycle lengths with slightly more vehicles stopping than LOS "A" causing slightly higher levels of average delay.
C	> 20 and ≤ 35	GOOD. Fair progression and longer cycle lengths lead to a greater number of vehicles stopping than LOS "B".
D	> 35 and ≤ 55	FAIR. Congestion becomes noticeable with higher average delays resulting from a combination of long cycle lengths, high volume-to-capacity ratios and unfavourable progression.
E	> 55 and ≤ 80	POOR. Lengthy delays values are indicative of poor progression, long cycle lengths and high volume-to-capacity ratios. Individual cycle failures are common with individual movement failures also common.
F	> 80	UNSATISFACTORY. Indicative of oversaturated conditions with vehicular demand greater than the capacity of the intersection.

APPENDIX F

Signal Warrant Analysis Worksheets

Input Data Sheet

Analysis Sheet | Results Sheet | Proposed Collision

GO TO Justification:

What are the intersecting roadways? Darby Road / McMann Sideroad and Highway 93

What is the direction of the Main Road street? North-South

When was the data collected? 2039 (Future Total - Weekday)

Justification 1 - 4: Volume Warrants

a.- Number of lanes on the Main Road? 1

b.- Number of lanes on the Minor Road? 1

c.- How many approaches? 4

d.- What is the operating environment? Rural **Population < 10,000 AND Speed >= 70 km/hr**

e.- What is the eight hour vehicle volume at the intersection? (Please fill in table below)

Hour Ending	Main Northbound Approach			Minor Eastbound Approach			Main Southbound Approach			Minor Westbound Approach			Pedestrians Crossing Main Road
	LT	TH	RT	LT	TH	RT	LT	TH	RT	LT	TH	RT	
8:00	9	482	0	2	1	7	2	494	4	0	0	2	0
9:00	9	460	1	5	0	10	1	433	0	0	0	4	0
10:00	9	351	0	11	1	6	1	384	4	0	0	1	0
13:00	5	360	0	4	1	5	0	382	4	0	0	0	0
15:00	2	420	1	5	0	4	1	398	6	0	0	2	0
16:00	0	428	0	1	0	4	2	487	2	0	1	1	0
17:00	0	528	1	0	0	1	6	566	2	0	0	4	0
18:00	1	525	0	5	0	0	0	467	5	1	0	0	0
Total	**35**	**3,554**	**3**	**33**	**3**	**37**	**13**	**3,611**	**27**	**1**	**1**	**14**	**0**

Justification 5: Collision Experience

Preceding Months	Number of Collisions*
1-12	0
13-24	0
25-36	0

* Include only collisions that are susceptable to correction through the installation of traffic signal control

Justification 6: Pedestrian Volume

a.- Please fill in table below summarizing total pedestrians crossing major roadway at the intersection or in proximity to the intersection (zones). Please reference Section 4.8 of the Manual for further explanation and graphical representation.

	Zone 1		Zone 2		Zone 3 (if needed)		Zone 4 (if needed)		Total
	Assisted	Unassisted	Assisted	Unassisted	Assisted	Unassisted	Assisted	Unassisted	
Total 8 hour pedestrian volume	10,000	5	10	5	0	0	0	0	
Factored 8 hour pedestrian volume	20,005		25		0		0		
% Assigned to crossing rate	23%		34%		30%		100%		
Net 8 Hour Pedestrian Volume at Crossing									4,610
Net 8 Hour Vehicular Volume on Street Being Crossed									2,000

b.- Please fill in table below summarizing delay to pedestrians crossing major roadway at the intersection or in proximity to the intersection (zones). Please reference Section 4.8 of the Manual for further explanation and graphical representation.

	Zone 1		Zone 2		Zone 3 (if needed)		Zone 4 (if needed)		Total
	Assisted	Unassisted	Assisted	Unassisted	Assisted	Unassisted	Assisted	Unassisted	
Total 8 hour pedestrian volume	10,000	5	10	5	0	0	0	0	
Total 8 hour pedestrians delayed greater than 10 seconds	10	10	1	6	2	4	0	0	
Factored volume of total pedestrians	20,005		25		0		0		
Factored volume of delayed pedestrians	30		8		8		0		
% Assigned to Crossing Rate	23%		34%		30%		100%		
Net 8 Hour Volume of Total Pedestrians									4,610
Net 8 Hour Volume of Delayed Pedestrians									12

Input Data Sheet

Analysis Sheet | Results Sheet | Proposed Collision | GO TO Justification:

What are the intersecting roadways? Darby Road / McMann Sideroad and Highway 93

What is the direction of the Main Road street? North-South

When was the data collected? 2039 (Future Total - Saturday)

Justification 1 - 4: Volume Warrants

a.- Number of lanes on the Main Road? 1

b.- Number of lanes on the Minor Road? 1

c.- How many approaches? 4

d.- What is the operating environment? Rural **Population < 10,000 AND Speed >= 70 km/hr**

e.- What is the eight hour vehicle volume at the intersection? (Please fill in table below)

Hour Ending	Main Northbound Approach			Minor Eastbound Approach			Main Southbound Approach			Minor Westbound Approach			Pedestrians Crossing Main Road
	LT	TH	RT	LT	TH	RT	LT	TH	RT	LT	TH	RT	
9:00	0	228	1	2	0	1	0	214	1	0	0	1	0
10:00	0	332	0	1	0	0	0	282	5	1	0	2	0
11:00	0	362	0	5	0	0	2	347	1	0	0	1	0
12:00	1	433	0	11	0	0	2	392	9	0	0	5	0
13:00	1	388	5	4	0	1	1	399	5	1	0	4	0
14:00	1	405	1	1	0	1	0	364	5	0	0	1	0
15:00	0	359	0	0	0	0	1	379	1	0	2	0	0
16:00	0	384	1	2	1	0	2	345	6	1	0	0	0
Total	**3**	**2,891**	**8**	**26**	**1**	**3**	**8**	**2,722**	**33**	**3**	**2**	**14**	**0**

Justification 5: Collision Experience

Preceding Months	Number of Collisions*
1-12	0
13-24	0
25-36	0

***** Include only collisions that are susceptable to correction through the installation of traffic signal control

Justification 6: Pedestrian Volume

a.- Please fill in table below summarizing total pedestrians crossing major roadway at the intersection or in proximity to the intersection (zones). Please reference Section 4.8 of the Manual for further explanation and graphical representation.

	Zone 1		Zone 2		Zone 3 (if needed)		Zone 4 (if needed)		Total
	Assisted	Unassisted	Assisted	Unassisted	Assisted	Unassisted	Assisted	Unassisted	
Total 8 hour pedestrian volume	10,000	5	10	5	0	0	0	0	
Factored 8 hour pedestrian volume	20,005		25		0		0		
% Assigned to crossing rate	23%		34%		30%		100%		
Net 8 Hour Pedestrian Volume at Crossing									4,610
Net 8 Hour Vehicular Volume on Street Being Crossed									2,000

b.- Please fill in table below summarizing delay to pedestrians crossing major roadway at the intersection or in proximity to the intersection (zones). Please reference Section 4.8 of the Manual for further explanation and graphical representation.

	Zone 1		Zone 2		Zone 3 (if needed)		Zone 4 (if needed)		Total
	Assisted	Unassisted	Assisted	Unassisted	Assisted	Unassisted	Assisted	Unassisted	
Total 8 hour pedestrian volume	10,000	5	10	5	0	0	0	0	
Total 8 hour pedestrians delayed greater than 10 seconds	10	10	1	6	2	4	0	0	
Factored volume of total pedestrians	20,005		25		0		0		
Factored volume of delayed pedestrians	30		8		8		0		
% Assigned to Crossing Rate	23%		34%		30%		100%		
Net 8 Hour Volume of Total Pedestrians									4,610
Net 8 Hour Volume of Delayed Pedestrians									12

Attachment **4**

September 25, 2019 Reference No. 11155365

Ms. Jessica Ferri
CRH Canada Group Inc.
2300 Steeles Avenue West, 4th Floor
Concord, Ontario
L4K 5X6

Dear Ms. Ferri:

Re: Professional Opinion Regarding Neighboring Domestic Wells Complaints - Teedon Pit Extension
North 1/2 of Lot 80, Concession 1, W.P.R & Part of Original Road Allowance between Lots 80 and 81, Concession 1, W.P.R, Township of Tiny, County of Simcoe
(Dufferin Aggregates, a division of CRH Canada Group Inc.)

1. Introduction

As requested, GHD has prepared the following letter in regards to the neighboring domestic wells near the Dufferin Aggregates (Dufferin), a division of CRH Canada Group Inc., Teedon Pit Extension located on the North 1/2 of Lot 80, Concession 1, W.P.R and Part of the original road allowance between Lot 80 and 81, Concession 1, W.P.R, Township of Tiny, County of Simcoe, Ontario.

During a recent meeting between the Township of Tiny, R.J. Burnside & Associates, CRH Canada Group Inc. and MHBC on September 12, 2019, it was requested by the Township of Tiny that a letter be prepared with a professional opinion on the neighboring domestic wells complaints and whether impacts can be anticipated as a result of pit operations.

2. Previous Investigations

Historically, residents have raised concerns regarding water quality and quantity issues related to operation of the Teedon Pit. A summary of the investigations is documented below.

2.1 2015 Alpha Investigation and Water Well Survey

Following a Public Meeting conducted on January 26, 2015 at the Planning and Development Department of the Township of Tiny, Alpha Environmental Services, Inc. (Alpha), the Consultant for the previous owner (K.J. Beamish Construction Co., Limited ï or Beamish), contacted many of the local residents to ascertain the nature of any concerns.

Alpha conducted a well survey to identify supply wells around the Teedon Pit. A total of 27 wells were identified. The water well survey identified four residents who indicated that they had well water quality

and/or quantity concerns. The four residents and an additional resident declined an offer to inspect and sample their wells by Alpha.

The five residents were:

- 1189 Marshall Road
- 6970 Highway 93
- 7062 Highway 93
- 1190 Marshall Road
- 1119 Marshall Road

A hydrogeologic assessment of the water quality concerns was conducted by Alpha in May 2015. The hydrogeologic assessment concluded that the silt in the domestic wells and the reduced water supply are not due to the operations at Teedon Pit.

The distance of these domestic wells from the Teedon Pit and their shallow nature preclude Teedon Pit from being the cause of silt in the water supply. It was noted by the May 2015 Alpha hydrogeologic assessment that the shallow overburden contains a significant amount of silt.

2.2 2015 Ministry of Environment, Conservation, and Parks (MECP) Assessment

Following the water well survey and investigation by Alpha in May 2015, the MECP reviewed water well interference complaints at 1189 Marshall Road, 6970 Highway 93 and 7062 Highway 93.

The MECP concurred with the assessment by Alpha and stated:

> *I do not believe that the water well impacts of the three water well interference complaintants are due to the water takings associated with the Permit for the Teedon Pit.*

The MECP added that poor well maintenance and/or construction may be the cause for the presence of silt in the domestic wells. The MECP correspondence in regards to the water well interference complaints are provided in Attachment A.

2.3 2017 Ontario Water Wells Services Inc. Domestic Well Survey and Water Analytical Samples

Ontario Water Wells Services Inc. on behalf of CRH Canada Group Inc. completed a focused domestic well survey and collected groundwater samples from five nearby domestic wells in late summer 2017 in response to complaints of silt in the domestic wells. The groundwater samples were collected by a licensed water well contractor. The addresses that participated in the interview, well inspection and had water quality samples collected as part of the domestic well survey were the following:

- 20 Darby Road
- 30 Darby Road

- 1189 Marshall Road
- 6970 Highway 93
- 7062 Highway 93

The groundwater quality data collected from these five domestic wells are summarized in the GHD Category 1 Permit-To-Take-Water Renewal Application ï Supporting Hydrologic and Hydrogeologic Study (January 2018) and indicate the following:

- Chloride levels are generally low ranging from less than 1.0 to 27 milligrams per litre (mg/L)
- Sulphate concentrations are low and range from 7.7 to 21 mg/L
- Sodium levels are generally low and range from 2.5 to 14 mg/L (aesthetic objective is 200 mg/L)
- Generally low concentrations of metals with the exception of iron (ranges from less than 100 to 470 mg/L which exceeds the aesthetic objective of 300 mg/L) and aluminum (ranges from less than 5 to 300 mg/L which exceeds the Ontario Drinking Water Quality Standards of 200 mg/L)
- Relatively high levels of magnesium ranging from 4,100 to 15,000 micrograms per litre (Õg/L)
- Manganese for the most part less than 2.0 Õg/L but at 1189 Marshall Road was 29 Õg/L

The groundwater quality data collected from these five domestic wells were typical of glacial deposits groundwater and are consistent with published regional groundwater quality reports (Singer et al 1999 Severn Sound Study) for this area.

The data did not show impact by Teedon Pit operations. In addition, the properties showed no sign of silt in any of the domestic wells at the time of the domestic well survey.

2.4 2018 GHD Domestic Well Survey

GHD, on behalf of CRH Canada Group Inc., completed a domestic well survey in 2018 for the properties within a 1 kilometre (km) radius of the Teedon Pit. This domestic well survey also included properties with historical water well complaints beyond the 1 km radius. The study area included 78 properties along Baseline Road South, Carpenter Sideroad, Darby Road, French Road, Highway 93, McMann Sideroad, Marshall Road, Stamp Sideroad, and Wood Road.

The MECP usually requires a domestic well survey to include properties within a 500 m radius of the proposed water taking location. The study area for this domestic well survey was significantly larger than the 500 m radius requirement by MECP.

Each property that had a house on the lot was visited by GHD staff between March 27 and April 12, 2018 and was asked to participate in answering a few questions regarding domestic well water usage or quality/quantity issues. Of the 78 properties visited, 38 completed the domestic well survey form with the GHD representative.

Based on the completed domestic well survey forms, water well records and previously completed water well surveys, a total of 55 wells were identified and assessed within the study area.

Assessment of Water Quantity

The identified wells were categorized as shallow and deep, with the well classified as shallow if less than 20 m and deep if more than 20 m for the purpose of this evaluation.

To place the quantity assessment into context and determine potential interference effects, historical pumping test and hydraulic monitoring data were evaluated as described below:

- A pumping test was conducted in March 2010 by Alpha in the on-Site water supply well PW1-09 (depth of 69.3 m) at a rate of 950 litres per minute (L/min). The cone of influence associated with the pumping test only extended 300 m with a maximum drawdown of 0.75 m measured in the nearest domestic well, which is also a deep well (57 m).
- In addition to the 2010 pumping test, the historical hydraulic monitoring data collected since 2009 have shown that only the deep domestic wells within 300 m of the Site could be potentially affected by operating PW1-09. Historically, water levels in shallow wells have not responded to pumping of PW1-09.

The locations of the 55 wells identified within the study area were compared to the 300 m cone of influence created by operating PW1-09 (as identified in the March 2010 pumping test data). Based on this, it was determined that:

- Only 10 wells were within the 300 m cone of influence.
- Of the 10 wells, only 4 of the wells are deep (>20 m) and could potentially be affected by operating PW1-09.
- The 4 deep wells had available drawdowns of 58 m, 38 m, 15 m and 37 m.
- A well located approximately 200 m east of PW1-09 that experienced a maximum of 0.75 m drawdown during the 2010 pumping test and less than 0.5 m of drawdown during regular operation of PW1-09. This is insignificant given the large available drawdown in the well.

Therefore, it was concluded that it is highly unlikely that operation of PW1-09 would result in water quantity interference effects in any nearby domestic wells.

Assessment of Water Quality

Eleven of the 38 residents who completed the survey reported silt issues in their wells.

The following hydrogeological factor is important in the evaluation of silt issues in domestic wells in the area:

- A thick section of aquitard material (primarily fine-grained deposits ï Local Aquitard) underlie the aggregate washing operations (Sump Pond and Silt Ponds) providing a low permeability layer of protection to the deeper aquifer.

The presence of the Local Aquitard isolates the aggregate washing operations from the deeper aquifer.

Furthermore, the silt issue complaints were already assessed by Alpha in May 2015 which concluded that silt in the domestic wells was not associated with the aggregate washing operations at the Teedon Pit. The MECP concurred with the review of the silt issue complaints and concluded that the silt issue in the domestic wells was not related to aggregate washing at the Teedon Pit. GHD concurs with both assessments.

2.5 Additional Investigations and Assessments

MECP and Ontario Geologic Survey (OGS) Involvement

Dufferin has been proactive with notifying and involving the MECP of activities occurring at the Site. The MECP and OGS were invited to observe the installation of new monitoring wells at the Site in March 2018. Dufferin and GHD have also shared geologic information from the new wells and boreholes with OGS and worked alongside OGS to confirm the Quaternary geology in the area of the Site.

Sump Pond Bank Inspections

In addition, representatives from MECP, Dufferin, GHD, and Anthony Goodban from Goodban Ecological Consulting Inc. have visited the aggregate washing operations at the Teedon Pit on a few occasions and found no evidence of silt emanating from the banks of the Sump Pond.

Site Hydrogeologic Conceptual Model and Estimated Groundwater Travel Time

The additional hydrogeologic data collected in 2018 were evaluated together with the existing data and were used to formulate a hydrogeologic conceptual model.

A three-dimensional diagram of the hydrogeologic conceptual model is provided in Attachment B.

Based on the hydrogeologic conceptual model, it would take approximately 19.5 to 34 years for water leaking from the Sump and Silt Ponds to travel vertically through the Local Aquitard and then horizontally through the underlying Upper Aquifer to reach the nearest domestic well. This would be the travel time for groundwater to move through the subsurface. Silt cannot move with groundwater as groundwater travels from one point to another.

3. Conclusions

Past claims by a small number of nearby residents to the water quality (silt) in their domestic wells as being caused by aggregate washing operations has been investigated extensively and were determined to be unfounded. The MECP has attributed the domestic well quality issues to the silty nature of the shallow overburden and/or poor well maintenance.

As stated in Section 7 of the Hydrogeological Assessment ï Location of the Water Table for the Teedon Pit Extension:

> *Since extraction will remain 1.5 m above the established groundwater table, there will be no impact to private wells or groundwater resources.*

Based on the significant number of historical and recent investigations and assessments, it is concluded by GHD that CRH Canada Group Inc. will not have any negative impacts on neighboring wells as a result of operation of the Teedon Pit or Teedon Pit Extension.

Should you have any questions, please do not hesitate to contact me.

Sincerely,

GHD

Gary I. Lagos, M.Sc., P. Geo.

November 23, 2015

Robert E. Graham
Cedarhurst Quarries & Crushing Limited
3300 King Vaughan Townline,
Post Office Box 250
King, Ontario, L7B 1B2

Dear Mr. Graham

The Ministry of Environment and Climate Change (MOECC) has reviewed the three water well interference complaints (Janet Irvine, Bonnie Pauze/Jake Pigeon, and Peter Anderson) regarding the Permit to Take Water # 4317-87CNZN (Permit) for Cedarhurst Quarries & Crushing Limited (Permit Holder) at the Teedon Pit, 90 Darby Road, Tiny Township (Teedon Pit).

I have concluded the following:

- I agree that when issuing the latest Permit, the MOECC should have kept the condition that required monitoring the surface elevation of the wash pond that was in the original 2008 Permit. I am requesting that Cedarhurst Quarries & Crushing Limited recommence with this type of monitoring effective immediately as outlined below in bullets *i* and *ii*, and provide the MOECC a response indicating your agreement to conduct said monitoring. The MOECC would also advise you that any requests to renew or amend the Permit will reinstate this condition.
  - i. *Prior to water being taken from the Wash Pond each year, the Permit Holder shall establish a staff gauge in the Wash Pond and determine the elevation of the staff gauge. The Permit Holder shall measure and record the Wash Pond water level at the start and end of each day on which taking occurs.*
  - ii. *If, during the year of operation, the elevation of the staff gauge is changed, the Permit Holder shall determine the new elevation.*

- The potential violations of the Permit regarding notification of well interference complaints have been forwarded to the local environmental officer who is planning on conducting a Permit inspection of the Teedon Pit in the near future.

- I believe that there have been sufficient hydrogeological investigations completed on-site to warrant the issuance of the Permit.

- I disagree with Mr. Ruland's conceptual model that silt from the wash pond is affecting local wells. It is not possible for silt to flow through a silt, sand and gravel aquifer as a silt plume as Mr. Ruland has proposed.

- I do not believe that the water well impacts of the three water well interference complainants are due to the water takings associated with the Permit for the Teedon Pit.

I have written separate letters to each of the complainants stating my above findings as well as commenting on their individual well issues. A copy of each of these letters is attached to this letter.

Should you have any questions, please do not hesitate to contact myself at (416) 325-7487 or Mr. Mihran Aslanyan, who will be taking over this file, at (416) 326-4418.

Sincerely,

Christopher Munro

November 23, 2015

Mrs. Janet Irvine
7062 Highway 93
Tiny Township, Ontario
L0K 2E1

Dear Ms. Irvine

The Ministry of Environment and Climate Change (MOECC) has reviewed your water well interference complaint regarding the Permit to Take Water # 4317-87CNZN (Permit) for Cedarhurst Quarries & Crushing Limited (Permit Holder) at the Teedoh Pit, 90 Darby Road, Tiny Township (Teedon Pit). In response to your complaint a site visit was conducted on June 30, 2015, and the Permit Holder's hydrogeologist, Ross Campbell, produced a water well assessment report dated August 2015. Acting on Mrs. Pauze and Mr. Pigeon's behalf, hydrogeologist, Wilf Ruland, conducted his own assessment and presented a report on October 20, 2015. In response, Mr. Campbell, produced another report responding to Mr. Ruland's report on November 5, 2015.

I have reviewed the above noted reports as well as the documentation within the file the MOECC has for this Permit and conclude the following:

- I agree that when issuing the latest Permit in 2010, the MOECC should have kept the condition that required monitoring the surface elevation of the wash pond that was in the original 2008 Permit. I am requesting that the Permit Holder recommence with this type of monitoring and recommend that upon any requests to renew or amend the Permit that this condition be reinstated.

- The potential violations of the Permit regarding notification of well interference complaints have been forwarded to the MOECC's local environmental officer who is planning on conducting a Permit inspection of the Teedon Pit in the near future.

- I believe that sufficient hydrogeological investigations were completed on-site to warrant the issuance of the Permit when it was issued in 2010.

- I disagree with Mr. Ruland's conceptual model that silt from the wash pond is affecting local wells, including your well. It is not possible for silt to flow through a silt, sand and gravel aquifer as a silt plume as Mr. Ruland has proposed.

- I do not believe that your water well impacts are due to the water takings associated with the Permit for the Teedon Pit.

During the site visit, you showed us the sediment that was collecting on the metal filter of your hot water tank and in the toilet tank. This material did not look like the silt/clay material of Mrs. Pauze. Mr. Campbell's water quality sample resulted in no detected total suspended solids or turbidity, iron related bacteria were present, and a background bacteria count of 1000 CFU/100 mL.

It is clear from the reported bacteria level that the well is contaminated with biological material that is likely due to construction of your well at surface. The top of your well is only about 2 inches above ground surface and the well cap has an open hole on the centre of it which is designed for piping to exit; however there is no pipe or other plug sealing this hole. The wellhead has a large overturned metal bowl shaped container loosely covering it. At the present your well is vulnerable to insects, vermin, horse manure runoff, and foreign mater entering your well through the top of the well.

The materials on your filter and toilet tank are likely from either material falling into your well from the hole in your well cap or from the scaling of the inside of the well casing.

I recommend that you hire a licenced water well technician to raise the height of your well, to install a protective well cap, and inspect/disinfect/clean the inside of the well casing. Should you have any questions, please do not hesitate to contact myself at (416) 325-7487 or Mr. Mihran Aslanyan, who will be taking over this file, at (416) 326-4418.

Sincerely,

Christopher Munro

Bonnie Pauze and Jake Pigeon
1189 Marshall Road
PO Box 1262
Tiny Township, Ontario
L0L 2J0

Dear Mrs. Pauze and Mr. Pigeon

The Ministry of Environment and Climate Change (MOECC) has reviewed your water well interference complaint regarding the Permit to Take Water # 4317-87CNZN (Permit) for Cedarhurst Quarries & Crushing Limited (Permit Holder) at the Teedon Pit, 90 Darby Road, Tiny Township (Teedon Pit). In response to your complaint a site visit was conducted on June 30, 2015, and the Permit Holder's hydrogeologist, Ross Campbell, produced a water well assessment report dated August 2015. Your hydrogeologist, Wilf Ruland, conducted his own assessment and presented a report on October 20, 2015. In response, Mr. Campbell, produced another report responding to Mr. Ruland's report on November 5, 2015.

I have reviewed the above noted reports as well as the documentation within the file the MOECC has for this Permit and conclude the following:

- I agree that when issuing the latest Permit in 2010, the MOECC should have kept the condition that required monitoring the surface elevation of the wash pond that was in the original 2008 Permit. I am requesting that the Permit Holder recommence with this type of monitoring and recommend that upon any requests to renew or amend the Permit that this condition be reinstated.

- The potential violations of the Permit regarding notification of well interference complaints have been forwarded to the MOECC's local environmental officer who is planning on conducting a Permit inspection of the Teedon Pit in the near future.

- I believe that sufficient hydrogeological investigations were completed on-site to warrant the issuance of the Permit when it was issued in 2010.

- I disagree with Mr. Ruland's conceptual model that silt from the wash pond is affecting local wells, including your well. It is not possible for silt to flow through a silt, sand and gravel aquifer as a silt plume as Mr. Ruland has proposed.

- I do not believe that your water well impacts are due to the water takings associated with the Permit for the Teedon Pit.

At the time of the site visit, it is clear that there is a silt issue with the well water at your house. I believe the silt issues with the house well and barn well are due to well construction and improper screen design. I cannot determine why the problem started in 2009; however, wells do deteriorate with age. My concern with the house well is that the silt that it is producing is likely coming from around the well screen (if a well screen is even present) and creating a void. With the house situated within a few metres of the well, I am concerned that this void may cause land subsidence that may damage or structurally compromise the house.

I strongly recommend that you hire a licensed well contractor and/or Professional Engineer/Professional Geoscientist to investigate your wells and that the appropriate actions be taken ensure that your wells stop discharging silt. Alternately, your current wells could be abandoned and a new well(s) be constructed.

Should you have any questions, please do not hesitate to contact myself at (416) 325-7487 or Mr. Mihran Aslanyan, who will be taking over this file, at (416) 326-4418.

Sincerely,

Dear Mr. Anderson

The Ministry of Environment and Climate Change (MOECC) has reviewed your water well interference complaint regarding the Permit to Take Water # 4317-87CNZN (Permit) for Cedarhurst Quarries & Crushing Limited (Permit Holder) at the Teedon Pit, 90 Darby Road, Tiny Township (Teedon Pit). In response to your complaint a site visit was conducted on June 30, 2015, and the Permit Holder's hydrogeologist, Ross Campbell, produced a water well assessment report dated August 2015. Acting on Mrs. Pauze and Mr. Pigeon's behalf, hydrogeologist, Wilf Ruland, conducted his own assessment and presented a report on October 20, 2015. In response, Mr. Campbell, produced another report responding to Mr. Ruland's report on November 5, 2015.

I have reviewed the above noted reports as well as the documentation within the file the MOECC has for this Permit and conclude the following:

- I agree that when issuing the latest Permit in 2010, the MOECC should have kept the condition that required monitoring the surface elevation of the wash pond that was in the original 2008 Permit. I am requesting that the Permit Holder recommence with this type of monitoring and recommend that upon any requests to renew or amend the Permit that this condition be reinstated.

- The potential violations of the Permit regarding notification of well interference complaints have been forwarded to the MOECC's local environmental officer who is planning on conducting a Permit inspection of the Teedon Pit in the near future.

- I believe that sufficient hydrogeological investigations were completed on-site to warrant the issuance of the Permit when it was issued in 2010.

- I disagree with Mr. Ruland's conceptual model that silt from the wash pond is affecting local wells, including your well. It is not possible for silt to flow through a silt, sand and gravel aquifer as a silt plume as Mr. Ruland has proposed.

- I do not believe that your water well impacts are due to the water takings associated with the Permit for the Teedon Pit.

Your well is a drilled well situated with a well pit, likely an old dug well, therefore the well head is not accessible and is located below ground. Mr. Campbell's water quality sample resulted in no detected total suspended solids or turbidity, and no bacteria issues. At the time of water quality sampling there appears to be no water quality issues.

Wells that are installed in well pits can be susceptible to being flooded and material can enter the well through the top of well at these times or even around the outside of the drilled well casing if an appropriate seal is not in place. I recommend that you hire a licenced water well technician to inspect your well and to potentially raise the height of your well to above ground level, fill in the well pit with low permeable material to create a good seal from surface water, and to install a protective well cap.

Should you have any questions, please do not hesitate to contact myself at (416) 325-7487 or Mr. Mihran Aslanyan, who will be taking over this file, at (416) 326-4418.

Sincerely,

Christopher Munro

Dear Ms. Ferri:

Re: Response to Hydrogeological Comments #1, #2, and #3f
Letter of Objection to an Application for a Category 3 Class A Licence Under the Aggregate Resources Act ï North 1/2 of Lot 80, Concession 1, W.P.R & Part of Original Road Allowance between Lots 80 and 81, Concession 1, W.P.R, Township of Tiny, County of Simcoe (Dufferin Aggregates, a division of CRH Canada Group Inc.)

1. Introduction

As requested, GHD has prepared the following responses to hydrogeological comments #1, #2, and #3f with regards to the Dufferin Aggregates (Dufferin), a division of CRH Canada Group Inc. Teedon Pit Extension (Site) located on the North 1/2 of Lot 80, Concession 1, W.P.R and Part of the original road allowance between Lot 80 and 81, Concession 1, W.P.R, Township of Tiny, County of Simcoe, Ontario.

During the notification and consultation period in regards to the proposed Teedon Pit Extension, comments were provided by the Township of Tiny to CRH Canada Group Inc. on March 25, 2019. Responses to the comments were submitted by CRH Canada Group Inc. to the Township of Tiny on June 20, 2019.

During a recent meeting between the Township of Tiny (Township), R.J. Burnside & Associates, CRH Canada Group Inc. and MHBC on September 12, 2019, it was requested by the Township of Tiny that the responses and supporting information be provided for the hydrogeological comments #1, #2, and #3f.

2. Comment #1

Township's March 25, 2019 Comment

The hydrogeological assessment completed by GHD does provide additional information on the geology in the vicinity of the sump pond/wash pond, however there is no discussion on how water levels in the ponds relate to levels in the local aquitard, the Newmarket Till, and the Upper Thorncliffe.

Dufferin's June 20, 2019 Response

The sump and wash ponds are located on the adjacent Teedon Pit. Discussion on how the ponds relate to the geology is not related to the pit extension application. For reference, we have included an electronic copy of the report prepared by GHD for the Teedon Pit titled "Category 1 Permit-To-Take-Water Renewal Application ï Supporting Hydrologic and Hydrogeologic Study".

GHD Response

Additional investigations were completed in 2018 in the vicinity of the Sump Pond. Four additional boreholes (BH1-18 to BH4-18) and three additional monitoring wells (MW6-18, MW6R-18 and MW7-18) were completed around the perimeter of the Sump Pond to provide additional stratigraphic information on the subsurface geology. Each of the new monitoring well locations, existing monitoring well MW1, and the Sump Pond were each equipped with dataloggers to measure the groundwater elevations.

The Site Hydrogeologic Cross-Sections as presented in the Hydrogeological Assessment ï Location of Water Table for the Teedon Pit Extension, which have incorporated all the 2018 subsurface investigation stratigraphic data, are presented herein as Figures 1 to 3. The hydrogeologic cross-sections have been updated to include the most recent groundwater elevation data from July 18, 2019.

Hydrogeologic cross-section A-A' and B-B' each show the relative location and completion depth of the Sump Pond compared to nearby monitoring wells and boreholes. Cross-sections A-A' and B-B' each show the Sump Pond and nearby shallow monitoring wells (MW1 and MW7-18) and boreholes (BH2-18 and BH3-18) are all completed within the Local Aquitard Unit. Deeper monitoring wells in the vicinity of the Sump Pond (MW6-18 and MW6R-18) are both completed within the Upper Aquifer Unit, specifically the Middle Thorncliffe Unit.

The monitoring wells completed in the Local Aquitard Unit (MW1 and MW7-18) all have similar elevations to the Sump Pond. The Sump Pond water elevation was about 263.8 on July 18, 2019 and the water elevations of the Aquitard Unit wells was approximately 259.5 m AMSL. The deeper monitoring wells completed in the vicinity of the Sump Pond within the Upper Aquifer Units (MW6-18 and MW6R-18) have July 18, 2019 groundwater elevations of approximately 238 m AMSL.

As shown on hydrogeologic cross-section A-A' and B-B', the monitoring wells completed within the Local Aquitard Unit (Thorncliffe Silt and Clay) have groundwater elevations over twenty metres higher than those completed in the Upper Aquifer Unit (Middle Thorncliffe).

There are no monitoring wells completed within the Newmarket Till at the Site because this unit is unsaturated within the Site.

The water table in the vicinity of the Sump Pond is within the Upper Aquifer Unit (Middle Thorncliffe) and found at elevations of approximately 238 m AMSL.

A local zone of saturation exists above the water table where the relatively impervious Local Aquitard interrupts/intercepts percolation causing groundwater saturation. This is not considered the water table for the purpose of establishing the on-Site water table due to its isolated nature and limited function.

Therefore, distinct and separate groundwater elevations exist at the Site in the vicinity of the Sump Pond for the Local Aquitard Unit (Thorncliffe Silt and Clay) versus the Upper Aquifer Unit (Middle Thorncliffe), as demonstrated by the groundwater elevation data and cross-sections.

3. Comment #2

Township's March 25, 2019 Comment

The addition of the new wells improves the understanding of the geology on the existing pit Site and in the proposed pit extension area. The following additional information is required for Burnside to complete their peer review:

- A table showing the dates that the manual water level data was collected and hydrographs showing the results for each well.
- Borehole logs for the wells so that the geology can be seen at each location. Based on the cross-sections, it appears that the sump pond/wash pond is effectively isolated from the underlying aquifer. The borehole logs would assist us with the interpretation of the extent of the silt and clay aquitard.
- A "regional" cross-section that includes the reported depths of the wells reportedly impacted by previous operations at the quarry.

Dufferin's June 20, 2019 Response

Please refer to the GHD report mentioned above as it addresses the requested information.

GHD Response

The manual groundwater elevation data is provided herein in Table 1 for the pumping well, monitoring wells and domestic wells and in Table 2 for the surface water monitoring location. Hydrographs for each of the monitoring locations are provided herein in Attachment A. The hydrographs show not only the manual elevation data but also the transducer data, where available, and precipitation data. All tables and hydrographs have been updated to include data from the most recent monitoring event on July 18, 2019.

Stratigraphic and instrumentation logs are provided in Attachment B for the monitoring wells completed in 2018 (MW5-18, MW6-18, MW6R-18, MW7-18, MW8-18, MW9-18, MW10S-18, and MW10D-18). In addition, the borehole logs are also provided in Attachment B that were completed in 2018 (BH1-18, BH2-18, BH3-18, and BH4-18). Hydrogeologic cross-sections that incorporate all the 2018 monitoring well and borehole stratigraphic data are also provided on Figures 1, 2, and 3.

Hydrogeologic cross-section A-A' which has the superimposed reported depths of the domestic wells which have had complaints are provided in Attachment C. Please note the following for this cross-section:

- The properties are far from the prepared hydrogeologic cross-sectional boundary and are therefore represent approximate conditions.
- Only two of the properties had water well records located (20 Darby and 7062 Hwy 93) while the information for the other properties was obtained from interviews during previous domestic water well surveys.
- Ground surface elevations were approximated from Google Earth imagery.

4. Comment #3f

Township's March 25, 2019 Comment

Testing be completed to evaluate the connection between the existing wash pond and the underlying aquifer. This may require the installation of additional shallow monitoring wells near the wash pond so that the water table can be monitored, and vertical gradients can be calculated. If it is found that the pond has the potential to impact groundwater water quality/quantity, then consideration should be given to the installation of a liner.

Dufferin's June 20, 2019 Response

The testing and monitoring requirements for the wash pond are not related to the Teedon Pit Extension and are subject to the PTTW application process. For reference refer to the GHD report titled "Category 1 Permit-To-Take-Water Renewal Application ï Supporting Hydrologic and Hydrogeologic Study"

GHD Response

As detailed in the Response to Comment #1, the water levels in the Sump Pond are similar to those monitoring wells within the shallower groundwater system and are classified as being within the Local Aquitard Unit, not the water table aquifer (i.e., Upper Aquifer). The Upper Aquifer is generally the source of water supply for the nearby domestic wells and for the aggregate washing operations within the existing Teedon Pit. There is no aggregate washing proposed within the Teedon Pit Extension.

As shown on hydrogeologic cross-section A-A' and B-B', the monitoring wells completed within the Local Aquitard Unit (Thorncliffe Silt and Clay) have groundwater elevations over twenty metres higher than those completed in the Upper Aquifer Unit (Middle Thorncliffe).

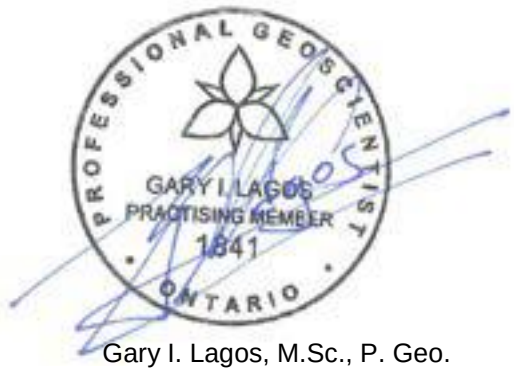
Notwithstanding the above information, vertical hydraulic gradients were calculated in the vicinity of the Sump Pond from the Local Aquitard to the Upper Aquifer Units.

Using the July 18, 2019 groundwater elevation data the vertical hydraulic gradient from the Sump pond within the Local Aquitard Unit to the underlying Aquifer Unit was calculated to be 0.7 downward and serve as evidence for the separation of the Sump Pond and Aquifer Unit.

Should you have any questions, please do not hesitate to contact me.

Sincerely,

GHD



Gary I. Lagos, M.Sc., P. Geo.

Note: PW1-09 was resurveyed on March 15, 2018. All hydraulic monitoring data has been re-calculated from this survey data.

Note: MW1 was resurveyed on March 15, 2018. All hydraulic monitoring data has been re-calculated from this survey data.

Note: MW1-09 was re-surveyed on July 19, 2018. All hydraulic monitoring data has been re-calculated from this survey data.

Note: MW4-10 was resurveyed on March 15, 2018. All hydraulic monitoring data has been re-calculated from this survey data.

Subject: RE: AGGREGATES - Teedon Pit Extension, Township of Tiny, Simcoe County

Hi Mallory,

I would recommend with the absence of any whop-poor-will (survey conducted as per protocol) that MECP would have no outstanding concern with the Teedon Pit extension.
